$$
P(A \text { or } B)=P(A)+P(B)-P(A \text { and } B)
$$

e.g. P(throwing an odd number and throwing a number less than 4)
$=\frac{3}{6}+\frac{3}{6}-\frac{2}{6}$
$=\frac{2}{3}$

## Contingency Tables

- Useful technique to visualise events
- Used to classify events according to two or more identifiable characteristics
e.g.

|  | Ace | Not Ace | Total |
| :--- | :--- | :--- | :--- |
| Red | 2 | 24 | 26 |
| Black | 2 | 24 | 26 |
| Total | 4 | 48 | 52 |

- Contingency tables are converted into probability tables
e.g.

|  | Ace | Not Ace | Total |
| :--- | :--- | :--- | :--- |
| Red | $2 / 52$ | $24 / 52$ | $26 / 52$ |
| Black | $2 / 52$ | $24 / 52$ | $26 / 52$ |
| Total | $4 / 52$ | $48 / 52$ | 1 |

Red $=$ joint probability
Blue $=$ marginal probability

## Conditional probability

- The probability of an event occurring, given that another event has occurred indicates that they are dependent events
- Conditional Probability: for dependent events, the probability of event A given the condition that event $B$ has already occurred is written as: $P(A / B)$
$\mathrm{P}(\mathrm{A} / \mathrm{B})=\frac{P(A \cap B)}{P(B)}$
