## Overview

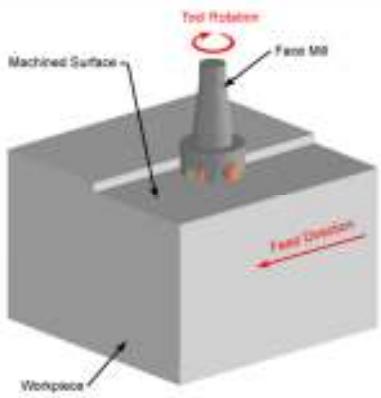

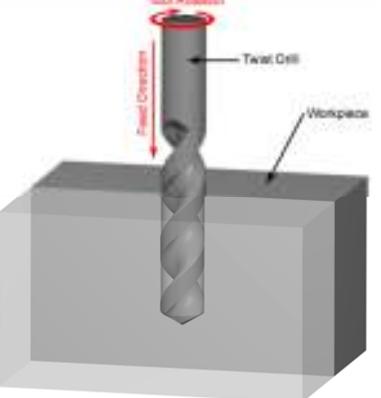

CNC – Computer Numerical Control.

- A specified instruction set is used to execute commands on a CNC machine in order to manufacture a part

## CNC Manufacturing

Milling operations:

End Milling	Chamfer Milling
Makes peripheral or slot cuts to machine a feature such as profile or slot.	Makes peripheral cut along edge of workpiece to create angled surface.

<b>Face Milling</b>	<b>Drilling</b>
<p>Machines a flat surface to provide a smooth finish.</p>  <p>The diagram illustrates Face Milling. A Face Mill is shown rotating clockwise (indicated by a red arrow labeled "Tool Rotation"). The mill is in contact with a "Workpiece". A "Machined Surface" is being created on the top face of the workpiece. A red arrow labeled "Feed Direction" indicates the linear movement of the tool across the workpiece.</p>	<p>Cuts a blind or through hole.</p>  <p>The diagram illustrates Drilling. A "Twist Drill" is shown rotating clockwise (indicated by a red arrow labeled "Tool Rotation"). The drill is in contact with a "Workpiece", creating a hole. A red arrow labeled "Feed Direction" indicates the linear movement of the tool into the workpiece.</p>

Others:

- **Boring** – commonly after drilling a hole in order to enlarge diameter or obtain precise dimension
- **Countersinking** – Enlarges top portion of existing hole to a cone-shape
- **Reaming** – Enlarges existing hole, obtain more accurate diameter and smooth finish
- **Tapping** – Cuts internal threads into an existing hole

## Basic Operations

### Programming Codes

<ul style="list-style-type: none"> <li>■ O - Program number (Used for Program identification)</li> <li>■ N - Sequence number (Used for line identification)</li> <li>■ G - Preparatory function</li> <li>■ X - X axis designation</li> <li>■ Y - Y axis designation</li> <li>■ Z - Z axis designation</li> </ul>	<ul style="list-style-type: none"> <li>■ R - Radius designation</li> <li>■ F – Feed rate designation</li> <li>■ S - Spindle speed designation</li> <li>■ H – Tool length offset designation</li> <li>■ D - Tool radius offset designation</li> <li>■ T - Tool Designation</li> <li>■ M - Action code or Machine code or Miscellaneous function</li> </ul>
--	---

For example:

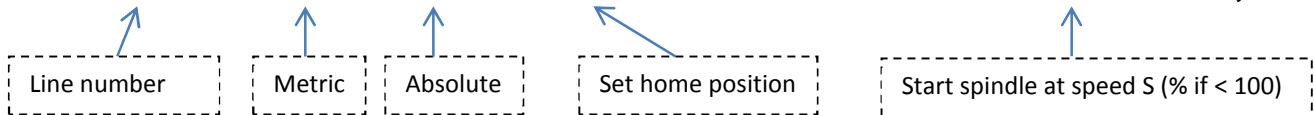

O0001;

**N010 G02 X1500 Y2000 R20 F100 S400;**

Omitted terms are assumed to be 0 or as previously defined.

General initialisation:

**N10 G21 G90 G92 X-125.0 Y0 Z75.0 M03 S30;**

## Positioning Systems

**Absolute** – position for movement is specified with respect to axis origin (G90)

**Incremental/Relative** – Specifies movement relative to the current tool location (G91)

## Motion Control

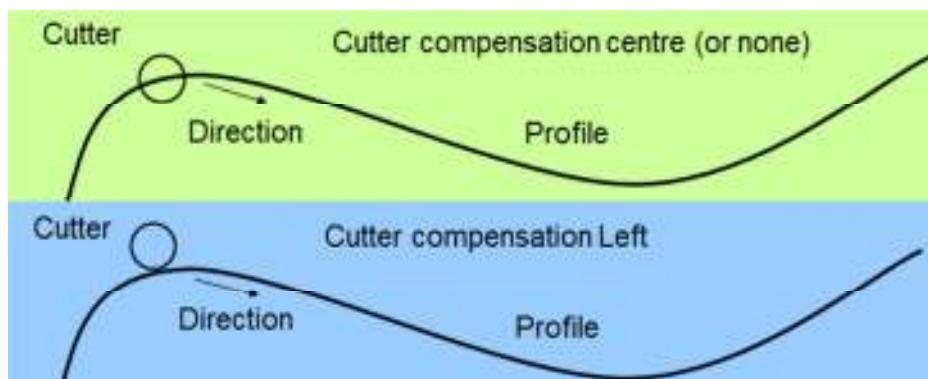

**Point-to-Point** – movement at maximum rate to a specified point, to position tool for other operations (G00)

**Continuous path** – Slower, controlled movement with specified feed rate for cutting (G01 (linear), G02, G03 (circular))

## Cutter Compensation

Can be used to automatically account for tool radius so that exact part profile can be specified for cutting motion (G41 – left, G42 – right).

- Activating cutter compensation in the block **before** movement (separate blocks) causes compensation to be effective from the start

Must previously store radius of tool using G10, and access it when G41 is called:

```
O0001;  
----  
N 0010 G10 P01 R1.5;  
N0020 M08;  
N0030 G17 G41 G01 X-10.0 Y-10.0 D01 F80.0;  
N0040 Y10.0;
```

'L' word can be used at end of line to repeat the execution of the line a specified number of times (usually used in incremental distance mode G91).
