## Microeconomics is

- The allocation of scarce resources
- The study of how economic agents behave individually
- What, how, when should I buy/produce?
- Helps us understand many economic and social issues e.g. marketing (consumer behaviour), finance (investment decisions - risk), trade (blocs, tariffs) etc.
- Positive vs. normative analysis
- Positive $=$ objective and fact based $\rightarrow$ micro approach
- Normative = subjective and value based

## L1: Constraints on Choice

-problems that consumers face
-how do these constraints affect the budget constraint and budget set

## Consumer Choice Sets

- A consumption choice set = the collection of all consumption choices available to the consumer
- What constrains consumption choice? budget, preferences, time and other resource limitations

## Budget Constraints

- Bundle = combination of two commodities
- ( $\mathrm{X} 1, \mathrm{X}_{2}$ ) denotes a consumption bundle containing X 1 units of commodity 1 and $\mathrm{X}_{2}$ units of commodity 2
- ( $\mathrm{P} 1, \mathrm{P}_{2}$ ) denotes their respective prices

## A Consumer's Budget Constraint is P1 X1 $+\mathbf{P 2} \mathbf{X 2}=\mathbf{m}$

- m = disposable income
- The bundles that are only just affordable form the consumer's budget constraint
- It is the upper boundary of the budget set

- Slope $=$ the opportunity cost of increasing a commodity by one unit, in terms of the other commodity e.g.

O.C. of an extra unit of commodity 1 is $\mathrm{p}_{1} / \mathrm{p}_{2}$ unit foregone of commodity 2

O.C. cost of an extra unit of commodity 2 is $\mathrm{p}_{2} / \mathrm{p}_{1}$ units foregone of commodity 1

## Income and Price Changes

- The budget constraint \& budget set depend upon prices and income
- How do these two change when p and m change?

Income (m):
i. Increases in income

- Higher income gives more choice
- budget constraint curve shifts outwards, in a parallel manner, enlarging the budget set
- new choices are added, so higher $m$ cannot make a consumer worse off
- Parallel/same slope because prices are fixed/relative and don't change

ii. Decreases in income
- Lower income gives less choice
- budget constraint curve shifts inwards, in a parallel manner, shrinking the budget set
- choices are removed from the budget set

## Price:

i. Reducing the price of only ONE commodity
E.g. $\mathrm{p}_{1}$ decreases from $\mathrm{p}_{1}{ }^{\prime}$ to $\mathrm{p}_{1}{ }^{\prime \prime}$

- New affordable choices
- budget constraint pivots outwards - slope flattens, enlarging the budget set
- no old choices are removed and new choices are added - consumer cannot be worse off

ii. Raising the price of only ONE commodity
- budget constraint pivots inwards, shrinking the budget set
- choices are reduced, making the consumer (typically) worse off

Uniform 'Ad Valorem' Sales Taxes:

- Applied uniformly to all commodities i.e. to both X1 and $\mathrm{X}_{2}$
- An ad valorem sales tax is levied at a rate of $5 \% \rightarrow$ increases price by $5 \%$, from $p$ to 1.05 p
- A uniform sales tax levied at rate $t$ changes the budget constraint to

$$
(1+\mathrm{t}) \mathrm{P} 1 \mathrm{X} 1+(1+\mathrm{t}) \mathrm{P} 2 \mathrm{X} 2=\mathrm{m} \quad \text { i.e. } \mathrm{P} 1 \mathrm{X} 1+\mathrm{P} 2 \mathrm{X} 2=\frac{\mathrm{m}}{(1+\mathrm{t})}
$$

- Equivalent income loss is

$$
\mathrm{m}-\frac{\mathrm{m}}{(1+\mathrm{t})}=\frac{\mathrm{t}}{(1+\mathrm{t})} \mathrm{m}
$$

- A uniform sales tax levied at rate $t$ is equivalent to an income tax levied at rate $\frac{t}{(1+t)}$
